Description

The PowerSensor+™ is an easy to use high performance, general purpose and pulse (modulation) power meter and sensor in one. High speed measurements and temperature compensated accuracy provide superior in-class performance. These instruments are suitable for making real time scalar analyzer measurements with 2000 readings per second.

Get up and running quickly with the CW and Pulse power meter panels. Easily Integrate the power sensors into Lab View, C, VB and other programming environments using the supplied drivers and programming examples.

Integration and usability are further simplified because calibration and zeroing are not required before use and, you have the flexibility of selecting from a variety of connector types including SMA, N, and 3.5 mm (male or female).

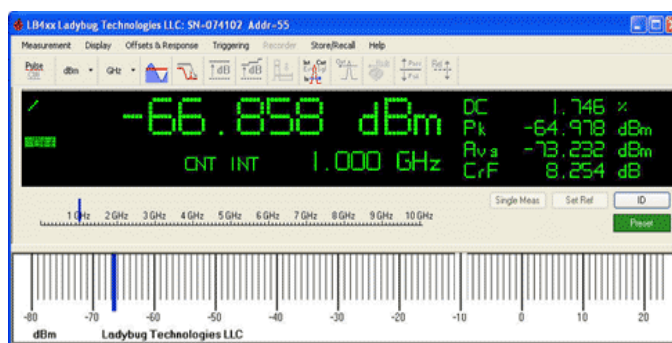

Unlike other CW sensors, the OSLB478A and OSLB479A can make a variety of Peak and Pulse Power measurements often found in power measurement solutions costing well over \$10,000.

¹ Error term definitions: Mm (Mismatch); CF (Cal Factor); N (Noise); L (Linearity); T (Temperature); Z (Zero Offset). All error terms are converted to percentages for RSS calculation.

² Use the following formula to determine Zero Offset error (%): $Z = (\text{Zero Offset Power} / \text{Measured Power}) \times 100$.

³ Linearity and Zero Offset are measured as a combined specification as LadyBug sensors require no meter zeroing or reference calibration before use.
